

ABSTRACT

The present invention provides a processing aid that reduces ungelled products and flow marks generated on a sheet, and improves releasability of the sheet from the metallic surface of a roll, with the processing aid comprising:

a copolymer (A) obtained by copolymerizing a monomer mixture comprising 70 to 90 % by weight of methyl methacrylate, 10 to 30 % by weight of acrylate or methacrylate other than methyl methacrylate and a different type of monomer capable of being copolymerized with those monomers; and

a copolymer (B) obtained by copolymerizing a monomer mixture comprising at least 30 % by weight of methyl methacrylate and a monomer having as constitutional units at least one type selected from methacrylates other than methyl methacrylate, acrylates, aromatic alkenyl compounds and other monomers.
